HireX — Known Issues, Technical Debt & Open Questions

Document ID: `HXP-HANDOVER-12`
Platform Version: HireX V0 / Pre-Release Baseline
Target Audience: Product Managers, Technical Leads, Architects, QA Leads
Last Updated: October 2026

---

1. Verified Implementation Gaps & Open Technical Questions

1.1 Direct Job Board API Posting (LinkedIn / Naukri)

- **Current Status:** Syndication is implemented via standard XML feeds (`/feeds/indeed-jobs.xml` , `/feeds/linkedin-jobs.xml` , `/feeds/naukri-jobs.xml`). Direct API posting logic is implemented but **fail-closed** (throws error if vendor endpoints are unset).
- **Blocker:** Requires enterprise API partner credentials and client IDs from LinkedIn Talent Solutions and Info Edge (Naukri).
- **Action for PM:** Coordinate enterprise vendor partner contracts to obtain live posting endpoints.

1.2 Custom Career Page CNAME SSL Termination

- **Current Status:** The candidate portal reverse proxy (`src/proxy.ts`) correctly intercepts foreign `Host` headers and rewrites them to the company's branded career portal.
- **External Dependency:** TLS certificate issuance for custom customer domains cannot be provisioned by the application code alone.
- **Recommendation:** Implement Cloudflare for SaaS (Custom Hostnames) or an AWS CloudFront distribution with automated SSL termination.

1.3 Schedular (MeetX) Development Fallback vs Live Staging Key

- **Current Status:** In `hirex-Backend/.env` , `SCHEDULAR_API_KEY` is commented out by default. In this mode, bookings generate mock URLs (`https://meet.hirex.dev/join/mtg_xxxx`).
- **Resolution:** To test with live video calls on staging, the platform team must supply the dev key for `https://api.dev.scheduler.zobay.in/api/v1` .

---

2. Technical Debt Register

Item ID	Component	Description	Impact	Priority	Recommended Action
TD-01	`hirex-Backend`	Duplicated interviewer auth controller (`src/auth/interviewer-auth.controller.ts` vs `src/interviewer/interviewer-auth.controller.ts`)	Maintenance overhead	Low	Consolidate into single controller in `src/auth/`
TD-02	`hirex-employer-frontend`	`applicants/[applicationId]/page.tsx` is over 3,500 lines long	Readability & code splitting	Medium	Decompose into smaller sub-components (`ApplicantHeader`, `ScorecardPanel`, `DocumentsTab`)
TD-03	`hirex-Backend`	`aiScore` falls back to TF-IDF when Groq API key is omitted	Quality variance	Low	Document fallback scoring behavior clearly for recruiters
TD-04	`hirex-frontend`	Mobile viewport stepper horizontal scroll	UX refinement	Low	Fine-tune drag-to-scroll momentum on small mobile devices

---

3. Unresolved Product Decisions (For Product Management)

1. **Offer Expiration Notification:** When an offer expires via the hourly cron, should the candidate receive an automated email notification informing them that the offer has lapsed, or should the recruiter reach out manually?
2. **Document Verification SLA:** Should the system enforce an automated reminder to candidates if mandatory onboarding documents are not uploaded within 72 hours of offer acceptance?
3. **Multi-Interviewer Scorecard Consensus:** In rounds with multiple panelists, should the system require all panelists to submit individual scorecards before the interview status transitions to `COMPLETED`, or allow partial completion?
